Section 1: Export notes

Sodium-ion batteries are entering commercial production for stationary storage. Their advantages are abundant raw materials, good low-temperature behaviour and a supply chain that does not depend on lithium or cobalt.

Certification is the gate to every export market. A battery pack that passes UN 38.3 transport testing still needs product and system certification in the destination country, and the two must not be confused in a quotation.

Pricing must be built from landed cost: ex-works pack price, dangerous-goods packaging and freight, insurance, duties and import fees. Anything else is a guess dressed as a number.
